

1. List and explain the options we have (applicable to the other entity set) when we delete tuples from a strong entity set in a relationship with a weak entity set.

Note: (Explain using an example constructed by you. No credit will be given if you are using the example/s discussed in the class).

Loan → Strong entity

Payment → Weak entity (depend on Loan, does not exist without loan) primary key (pay-id, loan id)

④ options use these when we delete tuples from strong entity set

1) ON DELETE NO ACTION → If I will try to remove any loan tuple it will not allowed because corresponding payment is there.

2) ON DELETE CASCADE → If I will delete any loan from Loan table all payments related to that loan will be deleted.

3) ON DELETE SET NULL → After deleting loan tuple corresponding loan-id in payment table ~~become NULL~~ ^{not possible here}

4) ON DELETE SET DEFAULT → If I will delete any loan then in payment table loan-id will be set to default value

1. Each question paper has four questions. Write your answers strictly in the space provided. Each question carries equal marks.

Here if we take example of a bank database then banks have customers. It is not necessary that each customer will have a loan but each loan would be having a customer.

1) Delete that related tuple from weak entity set (loans) First and then delete from strong entity set (Customer).

OR
2) Delete From strong entity set and make the value of partial key null.

OR
3) Remove the relation b/w those 2 tables for just that tuple and then delete the tuple from strong entity set.

Partially correct Explanation.

2. Think THREE most important database systems. List 4-5 databases and briefly explain their features.

0.5

a. DMKT Employees Database

Employee Table (emp_id (primary key), emp_name, emp_salary, emp_department, emp_address, emp_dept_id (FK), emp_dept_name, emp_dept_address, emp_dept_dept_id (FK), emp_dept_dept_name, emp_dept_dept_address)

Department Table (dept_id (primary key), dept_name, dept_address)

Customer Table (cust_id (primary key), cust_name, cust_address, cust_email, cust_phone, cust_fax, cust_contact, cust_contact_email, cust_contact_phone, cust_contact_fax)

Product Table (product_id (primary key), product_name, product_description, product_price, product_manufacturer, product_expiry, product_date)

Order Table (order_id (primary key), order_date, order_status, order_total, order_items, order_customer_id (FK), order_product_id (FK), order_manufacturer_id (FK), order_expiry_id (FK), order_date_id (FK))

b. Online Shopping Database

Customer Table (cust_id (primary key), cust_name, cust_email, cust_phone, cust_fax, cust_contact, cust_contact_email, cust_contact_phone, cust_contact_fax)

Product Table (product_id (primary key), product_name, product_description, product_price, product_manufacturer, product_expiry, product_date)

Order Table (order_id (primary key), order_date, order_status, order_total, order_items, order_customer_id (FK), order_product_id (FK), order_manufacturer_id (FK), order_expiry_id (FK), order_date_id (FK))

c. Airline Booking Database

Customer Table (cust_id (primary key), cust_name, cust_email, cust_phone, cust_fax, cust_contact, cust_contact_email, cust_contact_phone, cust_contact_fax)

Product Table (product_id (primary key), product_name, product_description, product_price, product_manufacturer, product_expiry, product_date)

3. Consider an entity set diagram (ERD) for a database system. The diagram shows the following entities and their attributes:

Entity: Student (Attributes: student_id, name, address, phone, email, dept_name, dept_id, dept_name, dept_address, dept_dept_id, dept_dept_name, dept_dept_address)

Entity: Department (Attributes: dept_id, dept_name, dept_address)

Entity: Customer (Attributes: cust_id, cust_name, cust_email, cust_phone, cust_fax, cust_contact, cust_contact_email, cust_contact_phone, cust_contact_fax)

Entity: Product (Attributes: product_id, product_name, product_description, product_price, product_manufacturer, product_expiry, product_date)

Entity: Order (Attributes: order_id, order_date, order_status, order_total, order_items, order_customer_id (FK), order_product_id (FK), order_manufacturer_id (FK), order_expiry_id (FK), order_date_id (FK))

Entity: Flight (Attributes: flight_id, flight_date, flight_status, flight_total, flight_items, flight_customer_id (FK), flight_product_id (FK), flight_manufacturer_id (FK), flight_expiry_id (FK), flight_date_id (FK))

Entity: Ticket (Attributes: ticket_id, ticket_date, ticket_status, ticket_total, ticket_items, ticket_customer_id (FK), ticket_product_id (FK), ticket_manufacturer_id (FK), ticket_expiry_id (FK), ticket_date_id (FK))

Entity: Resource (Attributes: resource_id, resource_type, resource_title, resource_price)

Entity: Experience (Attributes: experience_id, experience_date, experience_status, experience_total, experience_items, experience_customer_id (FK), experience_product_id (FK), experience_manufacturer_id (FK), experience_expiry_id (FK), experience_date_id (FK))

Entity: Issued (Attributes: issued_id, issued_date, issued_status, issued_total, issued_items, issued_customer_id (FK), issued_product_id (FK), issued_manufacturer_id (FK), issued_expiry_id (FK), issued_date_id (FK))

Entity: Returned (Attributes: returned_id, returned_date, returned_status, returned_total, returned_items, returned_customer_id (FK), returned_product_id (FK), returned_manufacturer_id (FK), returned_expiry_id (FK), returned_date_id (FK))

Entity: Student (Attributes: student_id, name, address, phone, email, dept_name, dept_id, dept_name, dept_address, dept_dept_id, dept_dept_name, dept_dept_address)

Entity: Department (Attributes: dept_id, dept_name, dept_address)

4.

Consider an entity set diagram (ERD) for a database system. The diagram shows the following entities and their attributes:

Entity: Student (Attributes: student_id, name, address, phone, email, dept_name, dept_id, dept_name, dept_address, dept_dept_id, dept_dept_name, dept_dept_address)

Entity: Department (Attributes: dept_id, dept_name, dept_address)

Entity: Customer (Attributes: cust_id, cust_name, cust_email, cust_phone, cust_fax, cust_contact, cust_contact_email, cust_contact_phone, cust_contact_fax)

Entity: Product (Attributes: product_id, product_name, product_description, product_price, product_manufacturer, product_expiry, product_date)

Entity: Order (Attributes: order_id, order_date, order_status, order_total, order_items, order_customer_id (FK), order_product_id (FK), order_manufacturer_id (FK), order_expiry_id (FK), order_date_id (FK))

Entity: Flight (Attributes: flight_id, flight_date, flight_status, flight_total, flight_items, flight_customer_id (FK), flight_product_id (FK), flight_manufacturer_id (FK), flight_expiry_id (FK), flight_date_id (FK))

Entity: Ticket (Attributes: ticket_id, ticket_date, ticket_status, ticket_total, ticket_items, ticket_customer_id (FK), ticket_product_id (FK), ticket_manufacturer_id (FK), ticket_expiry_id (FK), ticket_date_id (FK))

Entity: Resource (Attributes: resource_id, resource_type, resource_title, resource_price)

Entity: Experience (Attributes: experience_id, experience_date, experience_status, experience_total, experience_items, experience_customer_id (FK), experience_product_id (FK), experience_manufacturer_id (FK), experience_expiry_id (FK), experience_date_id (FK))

Entity: Issued (Attributes: issued_id, issued_date, issued_status, issued_total, issued_items, issued_customer_id (FK), issued_product_id (FK), issued_manufacturer_id (FK), issued_expiry_id (FK), issued_date_id (FK))

Entity: Returned (Attributes: returned_id, returned_date, returned_status, returned_total, returned_items, returned_customer_id (FK), returned_product_id (FK), returned_manufacturer_id (FK), returned_expiry_id (FK), returned_date_id (FK))

Entity: Student (Attributes: student_id, name, address, phone, email, dept_name, dept_id, dept_name, dept_address, dept_dept_id, dept_dept_name, dept_dept_address)

Entity: Department (Attributes: dept_id, dept_name, dept_address)

3

2. Identify THREE most important relations/tables u would expect to find in the following well known database systems. List all the attributes and identify a Primary Key for each of these relations/tables.

1/2

a. DAIICT Employee Database

1) Employee Details

- EID (P.K)
- Name
- Email ID
- Address

2) Course Details

- CID (P.K)
- EID (F.K)
- Course Name
- Subject Name
- class IDs

3) Salary

- Salary ID (P.K)
- CID (F.K)
- EID (F.K)
- Amount
- Duration

1

b. Online Shopping Database

1) User details

- User ID (P.K)
- Name
- Email ID
- Address
- History of orders
- Current cart items

2) Stock Inventory

- Product ID (P.K)
- Product Name
- Company Name
- Category Name
- MRP
- Offer Price
- Stock left of Product

3) Orders ~~received~~ details

- Order ID (P.K)
- User ID (F.K)
- Items in order
- Received date
- Delivered date
- Shipping details

1

c. Airline Booking Database

1) Passenger ~~class~~ details

- P-ID (P.K)
- Name
- Phone No.
- Emergency contacts
- Medical Insurance
- Medical history

2) Flights details

- Flight ID (P.K)
- Date of Departure
- Arrival date & time
- Pilot ~~info~~ details
- Machinery details

3) Tickets Booked

- Ticket No. (P.K)
- P-ID (F.K)
- Flight ID (F.K)
- Price details
- Food details

1/2

d. Resource Center of DAIICT

1) Books Inventory

- BID (P.K)
- CID (F.K)
- Name
- Author
- Issued to
- Price
- Publisher

2) Category Inventory

- C-ID (P.K)
- ~~cat~~ Name
- course
- Subjects ID

3) Availability

- BID (F.K)
- CID (F.K)
- Date of Issue
- Date of Return
- Total Books

4

3. Consider an entity set *Supervisor* (I-ID, L_name, dept_name, PhD_students, salary) defined for DAIICT PhD students Database. It represents the information regarding PhD students supervised by a Professor. In principle, a Professor may guide many PhD students.

Map this *Supervisor* Entity Set to the corresponding Relational Representation.

Two relations (tables) would be created

- 1) Supervisor
- 2) PhD-students

1. * Supervisor (I-ID (primary key), I-name, dept_name, salary)

2. * PHD-students (student-id (primary key), st-name, email, phone, address, I-ID (foreign key), since)

→ One supervisor can supervise many PhD-students. So it is one to many relationship two tables would be created in which PhD-students table would be having foreign key that maps to assigned supervisor.

→ Here PHD-students is multivalued attribute so different relation would be created for it.

3. Consider an entity set **Supervisor** (I-ID, I-name, dept_name, PhD_students, salary) defined for DAICT PhD students Database. It represents the information regarding PhD students supervised by a Professor. In principle, a Professor may guide many PhD students.
- Map this **Supervisor** Entity Set to the corresponding Relational Representation.

Entity set

* Relational Representation

constraints	fields
PK →	P ID
	Dept name
	name.

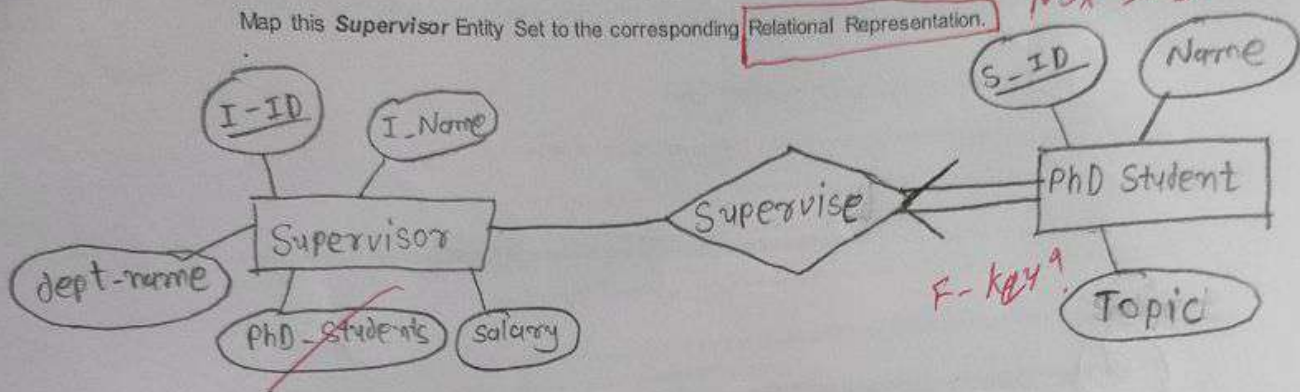

Supervisor	
PK	I-ID
FK	P-ID
	PhD_students
	dept_name
	Salary

→ 1 professor can ~~heath~~ supervise many PhD students
 ∴ P.K of Professor is F.K of Supervisor.!

3

3. Consider an entity set **Supervisor** (I-ID, I_Name, dept_name, PhD_students, salary) defined for DAIICT PhD students Database. It represents the information regarding PhD students supervised by a Professor. In principle, a Professor may guide many PhD students.

Map this **Supervisor** Entity Set to the corresponding Relational Representation.

→ From above diagram, we can say that :
Supervisor-supervise-PhD.Student is an one-to-many relationship.

However it is not necessary that all the supervisor has the students to supervise.

→ From PhD student entity, this relation has total participation. So, above relation can be mapped as:

✓ PhD_Student Supervised (S-ID, I-ID, Name, ~~Topic~~)
Supervisor (I-ID, I_Name, dept_Name, ~~PhD_students~~, salary)

2

Answer the following in the context of the Hierarchy in the E-R Model of Digital Library Database Management System.

This Hierarchy contains Resource (resource ID, title, price) as a super entity set. It has 3 sub-entity sets:

Books (author, publisher, no of Pages)

Journals (publication year, volume, editor, list of papers)

Videos (format, length)

Write how you map this Hierarchy to the corresponding Relational Model representation when

1

a. Covering Constraint is TRUE

Since covering constraint is true, every resource must be one of the three sub-entity sets. Mapping can be done in 2 ways:-

1) When converting to relational model every relation representing the sub-entities can also have attributes resource-ID, title and price in them. Also resource-ID will act as primary key.

2) Every sub entities can be assigned as primary key, which can and the relationship b/w Resource and sub-entities can be represented using another relation (table).

1

b. Covering Constraint is FALSE

Since covering constraint is false, every sub-entities may exist resources which are neither of the 3 sub-books, journals and videos.

Hence while mapping there will be separate relations for resource, books, journals and videos and other 3 can be represented using relations (separate tables).

2.

Answer the following in the context of the Hierarchy in the E-R Model of Digital Library Database Management System.

This Hierarchy contains Resource (resource ID, title, price) as a super entity set. It has 3 sub-entity sets:

Books (author, publisher, no of Pages)

Journals (publication year, volume, editor, list of papers)

Videos (format, length)

Write how you map this Hierarchy to the corresponding Relational Model representation when

a.

Covering Constraint is TRUE

~~Resource~~ (resource ID, title, price, resource Type)

~~Books~~ (author, publisher, no of Pages, resource Type)

~~Journals~~ (publication year, volume, editor, list of papers, resource Type)

~~Videos~~ (format, length, resource Type)

b.

Covering Constraint is FALSE

✓ Resource (resource ID, title, price)

✓ Books (resource ID, author, publisher, no of Pages)

✓ Journals (resource ID, publication year, volume, editor, list of papers)

✓ Videos (resource ID, format, length)

6 4. Answer the following in the context of the Hierarchy in the ER Model of Digital Library Database Management System.

This Hierarchy contains Resource (resource ID, title, price) as a super entity set. It has 3 sub-entity sets:

Books (author, publisher, no of Pages)

Journals (publication year, volume, editor, list of papers)

Videos (format, length)

Write how you map this Hierarchy to the corresponding Relational Model representation when

0 a. Covering Constraint is TRUE

→ It means All Resources in our system is either book, Journal or video.

→ Books and Journals and Videos covers Resource.

4 tables would be created

will be constraint there if false

(A) Resource (resource-id, title, price)

(B) Books (author, publisher, no of pages, resource ID (foreign key))

(C) Journals (publication year, volume, editor, list of papers, resource-id (foreign key))

(D) Videos (format, length, resource-id (foreign key))

0 b. Covering Constraint is FALSE

→ False means There are some resources in our system that does not cover books, Journals, or Videos these can be some other type of Resources.

→ Does all the resources are either books, Journals, videos? (Allowed / Disallowed)

→ Here FALSE means some resources does not belong to any of these three types.

④

4. Answer the following in the context of the Hierarchy in the E-R Model of Digital Library Database Management System.

This Hierarchy contains Resource (resource ID, title, price) as a super entity set. It has 3 sub-entity sets:

Books (author, publisher, no of Pages)

Journals (publication year, volume, editor, list of papers)

Videos (format, length)

Write how you map this Hierarchy to the corresponding Relational Model representation when

⑤

- a. Covering Constraint is TRUE

→ when there are more journals than the total number of books i.e. $\text{books} < \text{journals}$ then the covering constraint is true regarding the books. So, books are journals so all attributes of books would be inherited in the entity Journal and the ~~video~~ ~~or~~ ~~video~~ attributes of entity Resource. Also the videos entity will contain all the attributes of Resource entity.

⑥

- b. Covering Constraint is FALSE

→ when all the required data is distributed properly and there is no shortage then the covering constraint is true.
→ So attributes of Resource & Books would be inherited in journals & attributes of Resource would be inherited in Books & Videos.
